AUTHOR: Zawadzki, Antoni; Wieczorkowski, Zbigniew

TITLE: Problems of glass silk technology

SOURCE: Szkło i ceramika, no. 8, 1964, 197-199

TOPIC TAGS: glass cloth, glass fabric, glass fiber, fiberglass, glass silk, synthetic fiber, conference

ABSTRACT: The third international colloquium on fiberglass, organized by the Drezno Institute of Fiber Technology under the German Academy of Sciences, was held in October 16-18, 1963. The program included three groups of problems: 1) obtaining fiber-producing glass; 2) glass silk manufacture (properties of glass silk, test methods); and 3) finishing glass silk fabrics for reinforced plastics, and special problems concerning materials reinforced by fiberglass. The data presented at the colloquium indicate that the GDR and the Czechoslovak Socialist Republic devote much attention to finishing fabrics for reinforcing plastic materials and have set up machinery for the manufacture of "crown" glass fabrics. The Czechoslovak Socialist Republic is investing money in a new

Cord 1/2

ACCESSION NR: AP4044126

plant for the manufacture of fiberglass by continuous methods with a capacity that is two times higher than that of the existing plants. The GDR will erect a silk glass manufacturing plant capable of exceeding the silk glass output of the Czechoslovak Socialist Republic. Poland lacks the capacity of manufacturing "crown" glass fabrics for the reinforcement of plastics, or for decoration and filtration purposes. It is suggested that the Institute of Synthetic Fibers in Lodz establish direct cooperation with the Fiberglass Institute in Moscow and remedy the situation.

To study their fungicidal properties, 6-carboxy-methoxy- and 5-carboxy-methoxy-3-methyl-benzofuran (I and II), as well as 3-(6'-carboxy-methoxy-benzofuryl-3')- and 3-(5'-carboxy-methoxy-benzofuryl-3')-1,1,1-trichloro-2-hydroxy-propane (III and IV) were synthesized. 2,4-di-(carboxy-methoxy)-2-hydroxy-4-carboxy-methoxy-, 2,5-di-(carboxy-methoxy)- and 2-hydroxy-5-carboxy-methoxy-acetophenone (VI-IX) were obtained by boiling the Na salts of 2,4-dihydroxy-acetophenone (V) and of 2,5-dihydroxy-acetophenone with  $\text{ClCH}_2\text{COONa}$ ; compounds VI and VIII gave, with  $(\text{CH}_3\text{CO})_2\text{O}$ , I and II. A biological investigation of the compounds I-IV, VI-IX, and further of (Xa-e) showed that the introduction of the  $\text{HOOCCH}_2\text{O}$  group does not change the antimycotic properties. A mixture of 0.2 mole of NaOH in 20 ml of water, 0.4 mole of  $\text{ClCH}_2\text{COONa}$  in 100 ml of water, and 0.1 mole of V is heated for 1 hr, alkalized with 30 % NaOH, and boiled for 3 hrs. VI,  $\text{C}_{12}\text{H}_{12}\text{O}_7$ , m.p.  $220^\circ\text{C}$  (from water), and VII,  $\text{C}_{10}\text{H}_{10}\text{O}_5$ , m.p.  $159^\circ\text{C}$  (from water) are separated by acidification. VIII,  $\text{C}_{12}\text{H}_{12}\text{O}_7$ , yield 50 %, m.p.  $202^\circ\text{C}$  (from water), and IX,  $\text{C}_{10}\text{H}_{10}\text{O}_5$ , m.p.  $147^\circ\text{C}$  (from water) were ob-

Card 2/4

Investigation of compounds with ...

S/081/62/000/024/049/073  
B106/B186

tained in the same way. Boiling of 0.1 mole of V and 0.2 mole of NaOH in 30 ml of water with 0.15 mole of  $\text{ClCH}_2\text{COONa}$  in 40 ml of water (5 hrs) gave VII. IX was obtained similarly in 15 % yield. 3.5 g VII, 2 g  $\text{CH}_3\text{COOC}_2\text{H}_5$  and 1.3 g Na are boiled for 1 hr, 2 g  $\text{CH}_3\text{COOC}_2\text{H}_5$  is added to the comminuted precipitate, boiled for 30 min, the solvent is removed, the residue is treated with 5 ml of  $\text{CH}_3\text{COOH}$ , 1 ml of  $(\text{CH}_3\text{CO})_2\text{O}$  and 1 ml of conc. HCl, boiled for 30 min and diluted with water (1:10). 2-methyl-7-carboxy-methoxy-chromone,  $\text{C}_{12}\text{H}_{10}\text{O}_5$ , yield 37 %, m.p.  $276^\circ\text{C}$  (from alcohol) is obtained; the analogous chromone could not be obtained from IX. 0.1 mole of VI, 0.5 mole of  $(\text{CH}_3\text{CO})_2\text{O}$  and 5 g  $\text{CH}_3\text{COONa}$  are boiled for 1 hr, diluted with water and evaporated to dryness. This gives I, yield 70 %, m.p.  $142^\circ\text{C}$  (from water). II,  $\text{C}_{11}\text{H}_{10}\text{O}_4$ , yield 70 %, m.p.  $160^\circ\text{C}$  (from water) was obtained similarly. A mixture of 0.01 mole of I in  $\text{CH}_3\text{C}_6\text{H}_5$ -petroleum ether (1:1, b.p.  $90^\circ\text{C}$ ) and 0.015 mole of  $\text{CCl}_3\text{CHO}$  is boiled for 20 hrs ( $120^\circ\text{C}$ ), and III is isolated,  $\text{C}_{13}\text{H}_{11}\text{Cl}_3\text{O}_5$ , yield 40 %, m.p.  $152^\circ\text{C}$  (from  $\text{CH}_3\text{C}_6\text{H}_5$ ). IV,  $\text{C}_{13}\text{H}_{11}\text{Cl}_3\text{O}_5$ , yield 40 %, m.p.  $97^\circ\text{C}$   
Card 3/4

Investigation of compounds with ...

AUTHOR: Zawadowski, W. Member Polish Academy of Science

TITLE: The influence of ionizing radiations on the organism

PERIODICAL: Polska Akademia nauk. Nauka Polska, v. 10, no. 3, 1962, 18-21

TEXT: The author raises basic problems which should be studied in Poland in connection with the exact determination of the degrees of exposure of the population to small doses of ionizing radiations (X-rays, radioisotopes). The problems listed are: study of physical, biochemical, histological and functional changes in irradiated animal cells; influence of radiation on genetic material; radiation in professional exposures; carcinogenic properties of low dose radiations. It is planned that these problems should be studied in the Institute for Experimental and Clinical Medicine of the PAS which is still under construction. The following laboratories in Poland are engaged in work on some of these problems. The Isotope Section of the Oncological Institute trains physicians in basic nuclear techniques in medicine; the Institute of Biochemistry and Institute of Oncology in Warsaw and Gliwice, Department of Public Health Service in Warsaw and Department of Physiological Chemistry in Krakow study the biochemistry of proteins and nucleic acids by isotope techniques; the Department of Physiology (Bialystok) conducts radiological studies on the reactivity of adrenergic and cholinergic receptors, as well as searches for new protective agents against ionizing radiations. Pathophysiological and clinical

Card 1/2

1026/1226

studies in internal medicine are conducted in a Hospital in Poznan; use of radioisotopes in the cure of neoplasms is studied in the Institute of Oncology in Warsaw. The Department of Nuclear Medicine and Therapeutic Radiobiology in Warsaw, active since 1961, developed several new clinical methods for the use of radioisotopes as localization of cerebral tumors, liver-function tests and determination of circulation time in limbs. The Department of Therapeutic Radiobiology and the Institute of Industrial Hygiene in Lodz deal with health physics. ✓

**FOURTH:** This report is intended for geophysicists concerned with  
 cosmic radiation.

**CONTENTS:** This report contains the six primary sessions of the  
 conference. Most of the problems dealt with include nuclear  
 emissions, air showers and the program of cosmic  
 ray measurements planned for the International Geophysical  
 Year. Most of the reports are followed by references. Soviet  
 scientists in the field of cosmic radiation who attended the  
 conference are: E.L. Andromashvili, E.A. Dobrotin, I.I.  
 Gurevich, S.I. Nikol'skiy and S.M. Vainov. The articles are  
 written in English, German and Russian without parallel trans-  
 lations.

Title : Sensitization of Pigment Paper.

Orig Pub : Poligrafika, 1958, 10, No 4, 8-10

Abstract : Pigment paper (PP) is treated with a mixture of 2.5 - 3.5 percent  $K_2Cr_2O_7$  solution with 3 percent solution of gelatine. The light sensitivity of PP increases with the increase of  $K_2Cr_2O_7$  concentration, that should not be higher than the concentration at which the salt tends to crystallize. The

temperature of the process is maintained between 15 - 16°, and the duration of the treatment is approximately 3 minutes. The drying of PP is conducted on hot plates with a highly polished surface, in order to ascertain a good contact in the reproduction stage. The duration of drying is 1 hour and 30 minutes to 2 hours at 18-20°. It is recommended to store PP at a temperature of +5°. The usable life of the sensitized PP is 14 days. -- Ye. Gurvich

 of Hydrogen Sulfide and Carbon Disulfide in the \*  
 ORIG. PUB. : Prace Centr. inst. ochrony pracy, 1958, 8, No 3,  
 1-11  
 ABSTRACT : For the determination of  $H_2S$  and  $CS_2$  the analyzed  
 air is passed continuously through an absorbing  
 device, wherein a colorless reagent is introduced  
 simultaneously, which acquires a color when it  
 reacts with the above two components of the air.  
 The depth of color is proportional to the concen-  
 tration of components. The colored solution is  
 then transferred into a glass colorimeter, equi-  
 pped with photo-elements, where the color inten-  
 sity is measured by means of balancing a degree  
 \*Air.

Complexometric determination of phosphates in presence of soluble silicates

Krzyszna (Kurtzka) Henryka

and Barbara Bielecka (Bielecka)

Chemical Laboratory, Institute of Chemistry, Polish Academy of Sciences, Warsaw, Poland

The recommended procedure is as follows:

1. Weigh 0.1 g of sample and dissolve in 10 ml of water.

2. Add 1 ml of 10% NaOH solution and 1 ml of 1% Mg solution.

3. After the solution is clear, add 2 drops of methyl orange.

4. Neutralize the solution with 10% NaOH solution.

5. Add 20 ml of 0.1 M Na acetate buffer (pH 4.5).

6. Add 10 ml of 0.1 M Mg solution.

7. Dissolve in a small amount of HCl (1 ml) and dilute with water to 100 ml in presence of Bromocresol Black as an indicator.

TITLE: Magnetic and Electric Methods of Measuring the Thickness of Protective Coating

PERIODICAL: Pomlary-Automatyka-Kontrola, 1960, No. 6, pp. 208 - 211

TEXT: Several protective-coat meters are described and the operational principles explained. There are 3 types of coat meters which make use of the different magnetic properties of base and coat: disjunction meters, slug-core meters and electromagnetic meters. Another type are eddy-current meters. Examples of the first type are the "Smaltometer II" (Fig. 1) and "Smaltometer I" (Fig. 2), both made by the German firm Bayer. Accuracy is as low as 30%. The British made "Elecometer" is shown in Figure 3 as an example of a slug-core type; the error in this type meter is as high as 50%. An electromagnetic meter made by the GDR plant TFW is shown in Figure 6. The circuit diagram of the meter is shown in Figure 7. Another electromagnetic meter manufactured by the German company Karl Deutsch, a "Leptoskop", is shown in Figure 8. A third electromagnetic meter made by the West German institute of Dr. Förster is shown in Figure 10. There are 12 figures, 1 table and 7 references: 4 German, 2 Soviet and 1 English.

TITLE: Development of a method of studying the adhesion of electroplated coatings

SOURCE: Warsaw. Instytut Mechaniki Precyzyjnej. Prace, v. 13, no. 2(48), 1965, 9-16

TOPIC TAGS: adhesion, metal coating, copper, electroplating

ABSTRACT: A review and an evaluation are given of qualitative, semi-quantitative, and quantitative methods of studying adhesion of electroplated coatings. A new procedure developed at the Institute of Precision Mechanics (IMP), is described. The force needed for separating the coating (about 3 mm thick) from the end face of a rod-shaped sample is described. The results obtained from copper coatings on a steel base are given.
